

Baserri

Shotguns

Manufacturing Terminology

TRIBORE Barrel; has eliminated the forcing cone by gradually reducing the bore from .740 to .724 inch, which increases shot velocity, reduces felt recoil, and provides better patterns. No other barrel has the same performance!

Hyperbolic Profile Choke Tubes; let Baserri Shotgun confidently state that it is the only trademark in the United States which allows shooters to use STEEL SHOT in improved modified and full chokes. These Chokes are longer than any on the market (3 5/8" long), and use a patented curved side technology to allow for the use of steel shot without damage.

Deep Drilled Barrel; is similar to barrels used in high grade custom shop shotguns costing over \$10,000. Our barrels begin as solid bars of chrome molybdenum steel which are left out in the elements for one year. This exposure to heat, cold, rain, and dryness temper the steel, making it harder and harder. They are then drilled a series of three times to give us the best barrels in the world.

Titanium Finish; is used on our Hunting series of guns to create an unparalleled protection against rust and corrosion. It also is a harder finish which will last years in the field.

Strong Locking System; uses a large flat locking lug which is over 1" long. This lug is milled from a solid block of forged steel to create an extremely strong connection.

1630 Overpressure Test; every Baserri shotgun goes through this test before it leaves Italy. This proves that the Baserri shotgun is the strongest on the market. We are the only Shotgun in the United States that offers this guaranteed strength. All other shotguns are tested up to 1370 BAR. That equates to 18.9% lower pressure.

Every Baserri Shotgun has its own individual certificate included in its case.
